### 1.0. Introduction

The ACR122U is a PC-linked contactless smart card reader/writer used for accessing ISO 14443-4 Type A and Type B, Mifare, ISO 18092 or NFC, and FeliCa tags. The ACR122U is PC/SC compliant so it is compatible with existing PC/SC applications. Furthermore, the standard Microsoft CCID driver is used to simplify driver installation.

The ACR122U serves as the intermediary device between the personal computer and the contactless tag via the USB interface. The reader carries out the command from the PC whether the command is used in order to communicate with a contactless tag, or control the device peripherals (LED or buzzer).

The ACR122U uses the PC/SC APDUs for contactless tags following the PC/SC Specification and makes use of pseudo APDUs in sending commands for ISO 18092 tags and controlling the device peripherals. This document will discuss the ACR122U can be used in your smart card system.

#### 1.1. Features

- USB 2.0 Full Speed Interface
- CCID Compliance
- Smart Card Reader:
  - Read/Write speed of up to 424 kbps
  - Built-in antenna for contactless tag access, with card reading distance of up to 50 mm (depending on tag type)
  - Support for ISO 14443 Part 4 Type A and B cards, Mifare, FeliCa, and all four types of NFC (ISO/IEC 18092 tags)
  - o Built-in anti-collision feature (only one tag is accessed at any time)
- Application Programming Interface:
  - Supports PC/SC
  - Supports CT-API (through wrapper on top of PC/SC)
- Built-in Peripherals:
  - o User-controllable bi-color LED
  - User-controllable buzzer
- Supports Android™ OS 3.1 and above
- Compliant with the following standards:
  - o ISO 14443
  - o CE
  - o FCC
  - o KC
  - VCCI
  - PC/SC
  - o CCID
  - o Microsoft WHQL
  - RoHS

### 1.2. USB Interface

The ACR122U is connected to a computer through USB as specified in the USB Specification 1.1. The ACR122U is working in full-speed mode, i.e. 12 Mbps.

| Pin | Signal             | Function  |
|-----|--------------------|---|
| 1   | $\mathbf{V}_{BUS}$ | +5 V power supply for the reader (Max. 200 mA, Normal 100 mA) |
| 2   | D-                 | Differential signal transmits data between ACR122U and PC     |
| 3   | D+                 | Differential signal transmits data between ACR122U and PC     |
| 4   | GND                | Reference voltage level for power supply                      |

Table 1: USB Interface

## 2.0. Implementation

#### 2.1. Communication Flow Chart of ACR122U

The Standard Microsoft CCID and PC/SC drivers are used; thus, no ACS drivers are required because the drivers are already built inside the windows operating system. Your computer's registry settings can also be modified to be able to use the full capabilities of the ACR122U NFC Reader. See **Appendix A** for more details.

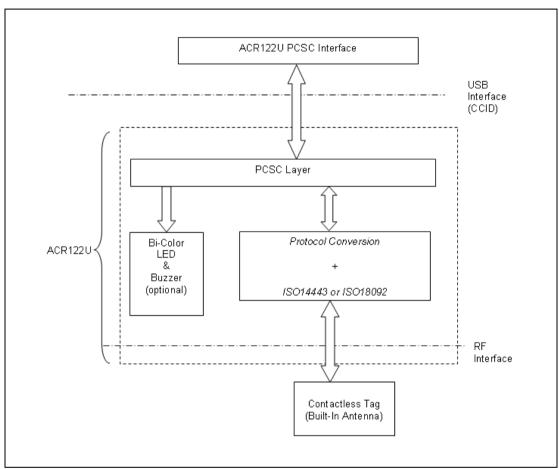

Figure 1: Communication Flow Chart of ACR122U

#### 2.2. Smart Card Reader Interface Overview

Click on the "Device Manager" to find out the "ACR122U PICC Interface." The standard Microsoft USB CCID Driver is used.

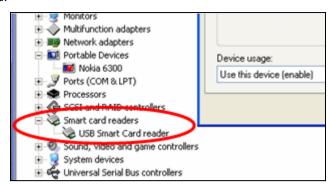

Figure 2: Smart Card Reader Interface on the Device Manager

## 3.0. PICC Interface Description

#### 3.1. ATR Generation

If the reader detects a PICC, an ATR will be sent to the PC/SC driver for identifying the PICC.

#### 3.1.1. ATR format for ISO 14443 Part 3 PICCs

| Byte | Value<br>(Hex) | Designation    | Description   |
|------|----------------|----------------|---|
| 0    | 3Bh            | Initial Header | -   |
| 1    | 8 <u>Nh</u>    | T0             | Higher nibble 8 means: no TA1, TB1, TC1 only TD1 is following.  Lower nibble N is the number of historical bytes (HistByte 0 to HistByte N-1) |
| 2    | 80h            | TD1            | Higher nibble 8 means: no TA2, TB2, TC2 only TD2 is following.  Lower nibble 0 means T = 0  |
| 3    | 01h            | TD2            | Higher nibble 0 means no TA3, TB3, TC3, TD3 following.  Lower nibble 1 means T = 1  |
|      | 80h            | T1             | Category indicator byte, 80 means A status indicator may be present in an optional COMPACT-TLV data object                                    |
| 4    | 4Fh            |                | Application identifier Presence Indicator   |
| 7    | 0Ch            |                | Length  |
| То   | RID            | Tk             | Registered Application Provider Identifier (RID) # A0 00 00 03 06h  |
| 3+N  | SS             |                | Byte for standard   |
|      | C0 C1h         |                | Bytes for card name   |
|      | 00 00 00 00h   | RFU            | RFU # 00 00 00 00h  |
| 4+N  | UUh            | TCK            | Exclusive-oring of all the bytes T0 to Tk   |

Table 2: ATR format for ISO 14443 Part 3 PICCs

#### **Example:**

ATR for Mifare 1K = {3B 8F 80 01 80 4F 0C A0 00 00 03 06 03 00 01 00 00 00 06 6Ah}

|                   | ATR |     |     |     |     |        |                       |          |              |                 |     |
|-------------------|-----|-----|-----|-----|-----|--------|-----------------------|----------|--------------|-----------------|-----|
| Initial<br>Header | T0  | TD1 | TD2 | T1  | Tk  | Length | RID                   | Standard | Card<br>Name | RFU             | тск |
| 3Bh               | 8Fh | 80h | 01h | 80h | 4Fh | 0Ch    | A0 00<br>00 03<br>06h | 03h      | 00 01h       | 00 00<br>00 00h | 6Ah |

Where:

Length (YY) = 0Ch

**RID** = A0 00 00 03 06h (PC/SC Workgroup)

**Standard (SS)** = 03h (ISO 14443A, Part 3)

**Card Name (C0 .. C1)** = [00 01h] (Mifare 1K)

Where, Card Name (C0 .. C1)

00 01h: Mifare 1K 00 02h: Mifare 4K

00 03h: Mifare Ultralight

00 26h: Mifare Mini

F0 04h: Topaz and Jewel

F0 11h: FeliCa 212K F0 12h: Felica 424K

FFh [SAK]: Undefined

#### 3.1.2. ATR format for ISO 14443 Part 4 PICCs

| Byte             | Value (Hex)      | Designation    | Description   |
|------------------|------------------|----------------|---|
| 0                | 3Bh              | Initial Header | -   |
| 1                | 8 <u>Nh</u>      | T0             | Higher nibble 8 means: no TA1, TB1, TC1 only TD1 is following.  Lower nibble N is the number of historical bytes (HistByte 0 to HistByte N-1)   |
| 2                | 80h              | TD1            | Higher nibble 8 means: no TA2, TB2, TC2 only TD2 is following.  Lower nibble 0 means T = 0  |
| 3                | 01h              | TD2            | Higher nibble 0 means no TA3, TB3, TC3, TD3 following.  Lower nibble 1 means T = 1  |
|                  | XXh              | T1             | Historical Bytes:   |
| 4<br>to<br>3 + N | XXh<br>XX<br>XXh | Tk             | ISO 14443A: The historical bytes from ATS response. Refer to the ISO14443-4 specification.  ISO 14443B: The higher layer response from the ATTRIB response (ATQB). Refer to the ISO14443-3 specification. |
| 4+N              | UUh              | TCK            | Exclusive-oring of all the bytes T0 to Tk   |

Table 3: ATR format for ISO 14443 Part 4 PICCs

We take for example, an ATR for DESFire, which is: DESFire (ATR) = 3B 86 80 01 06 75 77 81 02 80 00h

| ATR            |     |     |     |     |                 |     |  |
|----------------|-----|-----|-----|-----|-----------------|-----|--|
| Initial Hander | TO  | TD4 | TD2 |     |                 |     |  |
| Initial Header | 10  | TD1 |     | T1  | Tk              | TCK |  |
| 3Bh            | 86h | 80h | 01h | 06h | 75 77 81 02 80h | 00h |  |

This ATR has 6 bytes of ATS, which is: [06 75 77 81 02 80h]

**Note:** Use the APDU "FF CA 01 00 00h" to distinguish the ISO 14443A-4 and ISO 14443B-4 PICCs, and retrieve the full ATS if available. The ATS is returned for ISO14443A-3 or ISO14443B-3/4 PICCs.

Another example would be the ATR for ST19XRC8E, which is:

ST19XRC8E (ATR) = 3B 8C 80 01 50 12 23 45 56 12 53 54 4E 33 81 C3 55h

| ATR              |              |     |     |     |                                   |     |  |
|------------------|--------------|-----|-----|-----|-----------------------------------|-----|--|
| Initial Handay T | TO           | TD4 | TD2 |     | ATQB                              |     |  |
| Initial Header   | eader T0 TD1 | וטו |     | T1  | Tk                                | TCK |  |
| 3Bh              | 86h          | 80h | 01h | 50h | 12 23 45 56 12 53 54 4E 33 81 C3h | 55h |  |

Since this card follows ISO 14443 Type B, the response would be ATQB which is 50 12 23 45 56 12 53 54 4E 33 81 C3h is 12 bytes long with no CRC-B

Note: You can refer to the ISO7816, ISO14443 and PC/SC standards for more details.

## 4.0. PICC Commands for General Purposes

#### 4.1. Get Data

The "Get Data command" will return the serial number or ATS of the "connected PICC". Get UID APDU Format (5 Bytes)

| Command  | Class        | INS | P1  | P2  | Le            |
|----------|--------------|-----|-----|-----|---------------|
| Cot Doto | Get Data FFh | CAh | 00h | 00h | 00h           |
| Gel Dala |              |     | 01h | 00h | (Full Length) |

Get UID Response Format (UID + 2 Bytes) if P1 = 0x00h

| Response | Data Out |   |   |       |      |      |
|----------|----------|---|---|-------|------|------|
| Result   | UID      |   |   | UID   | SW1  | SW2  |
| Result   | (LSB)    | - | - | (MSB) | 3001 | 3002 |

Get ATS of a ISO 14443 A card (ATS + 2 Bytes) if P1 = 0x01h

| Response | Data Out |     |     |  |  |
|----------|----------|-----|-----|--|--|
| Result   | ATS      | SW1 | SW2 |  |  |

#### Response Codes

| Results | SW1 SW2 | Meaning                               |
|---------|---------|---------------------------------------|
| Success | 90 00h  | The operation completed successfully. |
| Error   | 63 00h  | The operation failed.                 |
| Error   | 6A 81h  | Function not supported.               |

#### Example:

- To get the serial number of the "connected PICC"
   UINT8 GET\_UID[5]={0xFFh, 0xCAh, 0x00h, 0x00h, 0x04h};
- 2. To get the ATS of the "connected ISO 14443 A PICC" UINT8 GET\_ATS[5]={0xFFh, 0xCAh, 0x01h, 0x00h, 0x04h};

# 5.0. PICC Commands (T=CL Emulation) for Mifare Classic Memory Cards

## 5.1. Load Authentication Keys

The "Load Authentication Keys command" will load the authentication keys into the reader. The authentication keys are used to authenticate the particular sector of the Mifare 1K/4K Memory Card. Volatile authentication key location is provided.

Load Authentication Keys APDU Format (11 Bytes)

| Command                  | Class | INS | P1            | P2         | Lc  | Data In       |
|--------------------------|-------|-----|---------------|------------|-----|---------------|
| Load Authentication Keys | FFh   | 82h | Key Structure | Key Number | 06h | Key (6 bytes) |

#### Where:

Key Structure: 1 Byte.

0x00h = Key is loaded into the reader volatile memory.

Other = Reserved.

Key Number: 1 Byte.

 $0x00h \sim 0x01h = Key Location$ . The keys will disappear once the reader is

disconnected from the PC.

**Key:** 6 Bytes.

The key value loaded into the reader. E.g. {FF FF FF FF FF FFh}

Load Authentication Keys Response Format (2 Bytes)

| Response | Data Out |     |  |
|----------|----------|-----|--|
| Result   | SW1      | SW2 |  |

#### Response Codes

| Results | SW1 SW2 | Meaning                               |
|---------|---------|---------------------------------------|
| Success | 90 00h  | The operation completed successfully. |
| Error   | 63 00h  | The operation failed.                 |

#### Example:

Load a key {FF FF FF FF FF FFh} into the key location 0x00h.

APDU = {FF 82 00 <mark>00</mark>h 06 FF FF FF FF FFh}

#### 5.2. Authentication

The "Authentication command" uses the keys stored in the reader to do authentication with the Mifare 1K/4K card (PICC). Two types of authentication keys are used: TYPE A and TYPE B.

Load Authentication Keys APDU Format (6 Bytes) [Obsolete]

| Command        | Class | INS | P1  | P2           | Р3       | Data In    |
|----------------|-------|-----|-----|--------------|----------|------------|
| Authentication | FFh   | 88h | 00h | Block Number | Кеу Туре | Key Number |

Load Authentication Keys APDU Format (10 Bytes)

| Command        | Class | INS | P1  | P2  | Lc  | Data In                 |
|----------------|-------|-----|-----|-----|-----|-------------------------|
| Authentication | FFh   | 86h | 00h | 00h | 05h | Authenticate Data Bytes |

Authenticate Data Bytes (5 Bytes)

| Byte1         | Byte 2 | Byte 3       | Byte 4   | Byte 5     |  |
|---------------|--------|--------------|----------|------------|--|
| Version 0x01h | 0x00h  | Block Number | Кеу Туре | Key Number |  |

#### Where:

**Block Number:** 1 Byte. This is the memory block to be authenticated.

Key Type: 1 Byte

0x60h = Key is used as a TYPE A key for authentication.0x61h = Key is used as a TYPE B key for authentication.

Key Number: 1 Byte

 $0x00h \sim 0x01h = Key Location.$ 

**Note:** For Mifare 1K Card, it has totally 16 sectors and each sector consists of 4 consecutive blocks. E.g. Sector 0x00h consists of Blocks {0x00h, 0x01h, 0x02h and 0x03h}; Sector 0x01h consists of Blocks {0x04h, 0x05h, 0x06h and 0x07h}; the last sector 0x0F consists of Blocks {0x3Ch, 0x3Dh, 0x3Eh and 0x3Fh}.

Once the authentication is done successfully, there is no need to do the authentication again if the blocks to be accessed belong to the same sector. Please refer to the Mifare 1K/4K specification for more details.

Load Authentication Keys Response Format (2 Bytes)

| Response | Data Out |     |  |
|----------|----------|-----|--|
| Result   | SW1      | SW2 |  |

#### Response Codes

| Results | SW1 SW2 | Meaning                               |
|---------|---------|---------------------------------------|
| Success | 90 00h  | The operation completed successfully. |
| Error   | 63 00h  | The operation failed.                 |

| Sectors<br>(Total 16 sectors. Each<br>sector consists of 4<br>consecutive blocks) | Data Blocks<br>(3 blocks, 16 bytes per<br>block) | Trailer Block<br>(1 block, 16 bytes) |     |  |
|---|--|--------------------------------------|-----|--|
| Sector 0  | 0x00 ~ 0x02h                                     | 0x03h                                | ] \ |  |
| Sector 1  | 0x04 ~ 0x06h                                     | 0x07h                                |     |  |

Table 6: Mifare Ultralight Memory Map

#### Example:

1. To authenticate the Block 0x04h with a {TYPE A, key number 0x00h}. For PC/SC V2.01, Obsolete.

APDU = {FF 88 00 04 60 00h};

2. To authenticate the Block 0x04h with a {TYPE A, key number 0x00h}. For PC/SC V2.07 alaAPDU = {FF 86 00 00 05 01 00 04 60 00h}

**Note:** Mifare Ultralight does not need to do any authentication. The memory is free to access.

## 5.3. Read Binary Blocks

The "Read Binary Blocks command" is used for retrieving "data blocks" from the PICC. The data block/trailer block must be authenticated first.

Read Binary APDU Format (5 Bytes)

| Command            | Class | INS | P1  | P2           | Le                      |
|--------------------|-------|-----|-----|--------------|-------------------------|
| Read Binary Blocks | FFh   | B0h | 00h | Block Number | Number of Bytes to Read |

#### Where:

Block Number: 1 Byte. The block to be accessed

Number of Bytes to Read: 1 Byte. Maximum 16 bytes

Read Binary Block Response Format (N + 2 Bytes)

| Response | Data Out     |     |     |  |  |
|----------|--------------|-----|-----|--|--|
| Result   | 0 <= N <= 16 | SW1 | SW2 |  |  |

#### Response Codes

| Results | SW1 SW2 | Meaning                               |
|---------|---------|---------------------------------------|
| Success | 90 00h  | The operation completed successfully. |
| Error   | 63 00h  | The operation failed.                 |

#### Example:

1. Read 16 bytes from the binary block 0x04h (Mifare 1K or 4K)

APDU = {FF B0 00 04 10h}

2. Read 4 bytes from the binary Page 0x04h (Mifare Ultralight)

 $APDU = \{FF B0 00 04 04h\}$ 

3. Read 16 bytes starting from the binary Page 0x04h (Mifare Ultralight) (Pages 4, 5, 6 and 7 will be read)

APDU = {FF B0 00 04 <mark>10</mark>h}

## 5.4. Update Binary Blocks

The "Update Binary Blocks command" is used for writing "data blocks" into the PICC. The data block/trailer block must be authenticated.

Update Binary APDU Format (4 or 16 + 5 Bytes)

| Command                 | Class | INS | P1  | P2              | Lc                                 | Data In   |
|-------------------------|-------|-----|-----|-----------------|------------------------------------|---|
| Update Binary<br>Blocks | FFh   | D6h | 00h | Block<br>Number | Number<br>of Bytes<br>to<br>Update | Block Data 4 Bytes for Mifare Ultralight or 16 Bytes for Mifare 1K/4K |

Where:

**Block Number:** 1 Byte. The starting block to be updated.

Number of Bytes to Update: 1 Byte.

16 bytes for Mifare 1K/4K4 bytes for Mifare Ultralight.

**Block Data:** 4 or 16 Bytes. The data to be written into the binary block/blocks.

#### Response Codes

| Results | SW1 SW2 | Meaning                               |
|---------|---------|---------------------------------------|
| Success | 90 00h  | The operation completed successfully. |
| Error   | 63 00h  | The operation failed.                 |

#### Example:

1. Update the binary block 0x04h of Mifare 1K/4K with Data  $\{00\ 01\ ..\ 0Fh\}$ 

APDU = {FF D6 00 04 10 00 01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0Fh}

2. Update the binary block 0x04h of Mifare Ultralight with Data (00 01 02 03)

APDU = {FF D6 00 04 04 00 01 02 03h}

#### 5.5. Value Block Related Commands

The data block can be used as value block for implementing value-based applications.

#### 5.5.1. Value Block Operation

The "Value Block Operation command" is used for manipulating value-based transactions. E.g. Increment a value of the value block etc.

Value Block Operation APDU Format (10 Bytes)

| Command                  | Class | INS | P1  | P2              | Lc  | Data In |                                    |
|--------------------------|-------|-----|-----|-----------------|-----|---------|------------------------------------|
| Value Block<br>Operation | FFh   | D7h | 00h | Block<br>Number | 05h | VB_OP   | VB_Value<br>(4 Bytes)<br>{MSB LSB} |

#### Where:

**Block Number:** 1 Byte. The value block to be manipulated.

VB\_OP: 1 Byte.

0x00h = Store the VB\_Value into the block. The block will then be converted to a value block.

0x01h = Increment the value of the value block by the VB\_Value. This command is only valid for value block.

0x02h = Decrement the value of the value block by the VB\_Value. This command is only valid for value block.

VB\_Value:

4 Bytes. The value used for value manipulation. The value is a signed long integer (4 bytes).

**Example 1:** Decimal  $-4 = \{0xFFh, 0xFFh, 0xFFh, 0xFCh\}$ 

| VB_Value |     |     |     |  |  |
|----------|-----|-----|-----|--|--|
| MSB LSB  |     |     |     |  |  |
| FFh      | FFh | FFh | FCh |  |  |

**Example 2:** Decimal  $1 = \{0x00h, 0x00h, 0x00h, 0x01h\}$ 

| VB_Value |         |     |     |  |  |  |
|----------|---------|-----|-----|--|--|--|
| MSB      | MSB LSB |     |     |  |  |  |
| 00h      | 00h     | 00h | 01h |  |  |  |

Value Block Operation Response Format (2 Bytes)

| Response | Data Out |     |  |  |
|----------|----------|-----|--|--|
| Result   | SW1      | SW2 |  |  |

#### Response Codes

| Results | SW1 SW2 | Meaning                               |  |  |  |
|---------|---------|---------------------------------------|--|--|--|
| Success | 90 00h  | The operation completed successfully. |  |  |  |
| Error   | 63 00h  | The operation failed.                 |  |  |  |

#### 5.5.2. Read Value Block

The "Read Value Block command" is used for retrieving the value from the value block. This command is only valid for value block.

Read Value Block APDU Format (5 Bytes)

| Command          | Class | INS | P1  | P2           | Le  |
|------------------|-------|-----|-----|--------------|-----|
| Read Value Block | FFh   | B1h | 00h | Block Number | 04h |

Where:

Block Number: 1 Byte. The value block to be accessed.

Read Value Block Response Format (4 + 2 Bytes)

| Response | Data Out           |     |     |  |  |
|----------|--------------------|-----|-----|--|--|
| Result   | Value<br>{MSB LSB} | SW1 | SW2 |  |  |

Where:

**Value:** 4 Bytes. The value returned from the card. The value is a signed long integer (4 bytes).

**Example 1:** Decimal –4 = {0xFFh, 0xFFh, 0xFFh, 0xFCh}

| Value |     |     |     |  |  |  |
|-------|-----|-----|-----|--|--|--|
| MSB   |     |     | LSB |  |  |  |
| FFh   | FFh | FFh | FCh |  |  |  |

**Example 2:** Decimal  $1 = \{0x00h, 0x00h, 0x00h, 0x01h\}$ 

| Value |     |     |     |  |  |  |
|-------|-----|-----|-----|--|--|--|
| MSB   |     |     | LSB |  |  |  |
| 00h   | 00h | 00h | 01h |  |  |  |

#### Response Codes

| Results | SW1 SW2 | Meaning                               |
|---------|---------|---------------------------------------|
| Success | 90 00h  | The operation completed successfully. |
| Error   | 63 00h  | The operation failed.                 |

#### 5.5.3. Restore Value Block

The "Restore Value Block command" is used to copy a value from a value block to another value block.

Restore Value Block APDU Format (7 Bytes)

| Command             | Class | INS | P1  | P2                  | Lc  |     | Data In                |
|---------------------|-------|-----|-----|---------------------|-----|-----|------------------------|
| Restore Value Block | FFh   | D7h | 00h | Source Block Number | 02h | 03h | Target Block<br>Number |

#### Where:

Source Block Number: 1 Byte. The value of the source value block will be copied to the

target value block.

Target Block Number: 1 Byte. The value block to be restored. The source and target value

blocks must be in the same sector.

Restore Value Block Response Format (2 Bytes)

| Response | Data | Out |
|----------|------|-----|
| Result   | SW1  | SW2 |

#### Response Codes

| Results | SW1 SW2 | Meaning                               |
|---------|---------|---------------------------------------|
| Success | 90 00h  | The operation completed successfully. |
| Error   | 63 00h  | The operation failed.                 |

#### Example:

1. Store a value "1" into block 0x05h

APDU = {FF D7 00 05 05 00 00 00 00 01h}

Answer: 90 00h

2. Read the value block 0x05h

 $APDU = \{FF B1 00 05 00h\}$ 

Answer: 00 00 00 01 90 00h [9000h]

3. Copy the value from value block 0x05h to value block 0x06h

APDU = {FF D7 00 05 02 03 06h}

Answer: 90 00h [9000h]

4. Increment the value block 0x05h by "5"

APDU = {FF D7 00 05 05 01 00 00 00 05h}

Answer: 90 00h [9000h]

## 6.0. Pseudo-APDUs

Pseudo-APDUs are used for the following:

- Exchanging Data with Non-PC/SC Compliant Tags.
- Retrieving and setting the reader parameters.
- The Pseudo-APDUs can be sent through the "ACR122U PICC Interface" if the tag is already connected.
- Or the Pseudo-APDUs can be sent by using "Escape Command" if the tag is not presented
  yet.

#### 6.1. Direct Transmit

This is the Payload to be sent to the tag or reader.

Direct Transmit Command Format (Length of the Payload + 5 Bytes)

| Command            | Class | INS   | P1    | P2    | Lc                            | Data In |
|--------------------|-------|-------|-------|-------|-------------------------------|---------|
| Direct<br>Transmit | 0xFFh | 0x00h | 0x00h | 0x00h | Number<br>of Bytes<br>to send | Payload |

Where:

Lc: 1 Byte. Number of Bytes to Send

Maximum 255 bytes

Data In: Response

**Direct Transmit Response Format** 

| Response        | Data Out      |
|-----------------|---------------|
| Direct Transmit | Response Data |

### 6.2. Bi-Color LED and Buzzer Control

This APDU is used to control the states of the Bi-Color LED and Buzzer. Bi-Color LED and Buzzer Control Command Format (9 Bytes)

| Command                               | Class | INS   | P1    | P2                      | Lc    | Data In<br>(4 Bytes)         |
|---------------------------------------|-------|-------|-------|-------------------------|-------|------------------------------|
| Bi-Color and<br>Buzzer<br>LED Control | 0xFFh | 0x00h | 0x40h | LED<br>State<br>Control | 0x04h | Blinking Duration<br>Control |

P2: LED State Control

| CMD   | Item                             | Description                           |
|-------|----------------------------------|---------------------------------------|
| Bit 0 | Final Red LED State              | 1 = On; 0 = Off                       |
| Bit 1 | Final Green LED State            | 1 = On; 0 = Off                       |
| Bit 2 | Red LED State Mask               | 1 = Update the State<br>0 = No change |
| Bit 3 | Green LED State Mask             | 1 = Update the State<br>0 = No change |
| Bit 4 | Initial Red LED Blinking State   | 1 = On; 0 = Off                       |
| Bit 5 | Initial Green LED Blinking State | 1 = On; 0 = Off                       |
| Bit 6 | Red LED Blinking Mask            | 1 = Blink<br>0 = Not Blink            |
| Bit 7 | Green LED Blinking Mask          | 1 = Blink<br>0 = Not Blink            |

Table 7: Bi-Color LED and Buzzer Control Format (1 Byte)

Data In: Blinking Duration Control

Bi-Color LED Blinking Duration Control Format (4 Bytes)

| Byte 0  | Byte 1   | Byte 2               | Byte 3         |
|---|--|----------------------|----------------|
| T1 Duration Initial Blinking State (Unit = 100ms) | T2 Duration Toggle Blinking State (Unit = 100ms) | Number of repetition | Link to Buzzer |

Where:

Byte 3: Link to Buzzer. Control the buzzer state during the LED Blinking.

0x00h: The buzzer will not turn on

0x01h: The buzzer will turn on during the T1 Duration 0x02h: The buzzer will turn on during the T2 Duration

0x03h: The buzzer will turn on during the T1 and T2 Duration.

Data Out: SW1 SW2. Status Code returned by the reader.

| Results | SW1 | SW2               | Meaning                               |
|---------|-----|-------------------|---------------------------------------|
| Success | 90h | Current LED State | The operation completed successfully. |
| Error   | 63h | 00h               | The operation failed.                 |

| Status     | Item              | Description     |
|------------|-------------------|-----------------|
| Bit 0      | Current Red LED   | 1 = On; 0 = Off |
| Bit 1      | Current Green LED | 1 = On; 0 = Off |
| Bits 2 – 7 | Reserved          |                 |

Table 8: Current LED State (1 Byte)

#### Notes:

- 1. The LED State operation will be performed after the LED Blinking operation is completed.
- 2. The LED will not be changed if the corresponding LED Mask is not enabled.
- 3. The LED will not be blinking if the corresponding LED Blinking Mask is not enabled. Also, the number of repetition must be greater than zero.
- 4. T1 and T2 duration parameters are used for controlling the duty cycle of LED blinking and Buzzer Turn-On duration. For example, if T1=1 and T2=1, the duty cycle = 50%. #Duty Cycle = T1/(T1 + T2).
- 5. To control the buzzer only, just set the P2 "LED State Control" to zero.
- 6. The make the buzzer operating, the "number of repetition" must greater than zero.
- 7. To control the LED only, just set the parameter "Link to Buzzer" to zero.

## 6.3. Get the Firmware Version of the Reader

This is used to retrieve the firmware version of the reader.

Command Format (5 Bytes)

| Command              | Class | INS   | P1    | P2    | Le    |
|----------------------|-------|-------|-------|-------|-------|
| Get Firmware Version | 0xFFh | 0x00h | 0x48h | 0x00h | 0x00h |

Response Format (10 Bytes)

| Response | Data Out         |
|----------|------------------|
| Result   | Firmware Version |

E.g. Response = 41 43 52 31 32 32 55 32 30 31h (Hex) = ACR122U201 (ASCII)

## 6.4. Get the PICC Operating Parameter

This is used to retrieve the PICC Operating Parameter of the reader.

Command Format (5 Bytes)

| Command                            | Class | INS   | P1    | P2    | Le    |
|------------------------------------|-------|-------|-------|-------|-------|
| Get PICC<br>Operating<br>Parameter | 0xFFh | 0x00h | 0x50h | 0x00h | 0x00h |

Response Format (1Byte)

| Response | Data Out                 |
|----------|--------------------------|
| Result   | PICC Operating Parameter |

## 6.5. Set the PICC Operating Parameter

This is used to set the PICC Operating Parameter of the reader.

Command Format (5 Bytes)

| Command                            | Class | INS   | P1    | P2                              | Le    |
|------------------------------------|-------|-------|-------|---------------------------------|-------|
| Set PICC<br>Operating<br>Parameter | 0xFFh | 0x00h | 0x51h | New PICC Operating<br>Parameter | 0x00h |

#### Response Format (1 Byte)

| Response | Data Out                 |
|----------|--------------------------|
| Result   | PICC Operating Parameter |

| Bit | Parameter  | Description   | Option                    |
|-----|--|---|---------------------------|
| 7   | Auto PICC Polling  | To enable the PICC Polling  | 1 = Enable<br>0 = Disable |
| 6   | Auto ATS Generation  | To issue ATS Request whenever an ISO14443-4 Type A tag is activated | 1 = Enable<br>0 = Disable |
| 5   | Polling Interval   | To set the time interval between successive PICC Polling.           | 1 = 250 ms<br>0 = 500 ms  |
| 4   | FeliCa 424K  |   | 1 = Detect<br>0 = Skip    |
| 3   | FeliCa 212K  |   | 1 = Detect<br>0 = Skip    |
| 2   | Topaz  | The Tag Types to be detected  | 1 = Detect<br>0 = Skip    |
| 1   | ISO 14443 Type B   | during PICC Polling.  | 1 = Detect<br>0 = Skip    |
| 0   | ISO 14443 Type A #To detect the Mifare Tags, the Auto ATS Generation must be disabled first. |   | 1 = Detect<br>0 = Skip    |

**Table 9**: PICC Operating Parameter. (Default Value = FFh)

### 6.6. Set Timeout Parameter

This is used to set the Time out Parameter of the contactless chip response time.

Command Format (5 Bytes)

| Command                  | Class | INS   | P1    | P2                                  | Le    |
|--------------------------|-------|-------|-------|-------------------------------------|-------|
| Set Timeout<br>Parameter | 0xFFh | 0x00h | 0x41h | Timeout Parameter<br>(Unit: 5 sec.) | 0x00h |

#### Where:

#### P2: Timeout Parameter.

0x00h: No Timeout check

0x01h – 0xFEh: Timeout with 5 second unit 0xFFh: Wait until the contactless chip responds

#### Response Format (8 Bytes)

| Results | SW1 SW2 | Meaning                               |
|---------|---------|---------------------------------------|
| Success | 90 00h  | The operation completed successfully. |
| Error   | 63 00h  | The operation failed.                 |

## 6.7. Set Buzzer Output Enable for Card Detection

This is used to set the buzzer output during card detection. The default output is ON. Command Format (5 Bytes)

| Command                                    | Class | INS   | P1    | P2             | Le    |
|--|-------|-------|-------|----------------|-------|
| Set Buzzer<br>Output for<br>Card Detection | 0xFFh | 0x00h | 0x52h | PollBuzzStatus | 0x00h |

#### Where:

#### P2: PollBuzzStatus.

0x00h: Buzzer will NOT turn ON when a card is detected

0xFFh: Buzzer will turn ON when a card is detected

#### Response Format (8 Bytes)

| Results | SW1 SW2 | Meaning                               |
|---------|---------|---------------------------------------|
| Success | 90 00   | The operation completed successfully. |
| Error   | 63 00   | The operation failed.                 |

## 7.0. Basic Program Flow for Contactless Applications

Step 0. Start the application. The reader will do the PICC Polling and scan for tags continuously.

Once the tag is found and detected, the corresponding ATR will be sent to the PC. You must make sure that the PC/SC Escape Command has been set. See **Appendix A** for more details.

Step 1. The first thing is to connect the "ACR122U PICC Interface".

Step 2. Access the PICC by sending APDU commands.

:

Step N. Disconnect the "ACR122U PICC Interface". Shut down the application.

#### Notes:

- 1. The antenna can be switched off in order to save the power.
  - Turn off the antenna power: FF 00 00 00 04 D4 32 01 00h
  - Turn on the antenna power: FF 00 00 00 04 D4 32 01 01h
- 2. Standard and Non-Standard APDUs Handling.
  - PICCs that use Standard APDUs: ISO14443-4 Type A and B, Mifare .. etc
  - PICCs that use Non-Standard APDUs: FeliCa, Topaz .. etc.

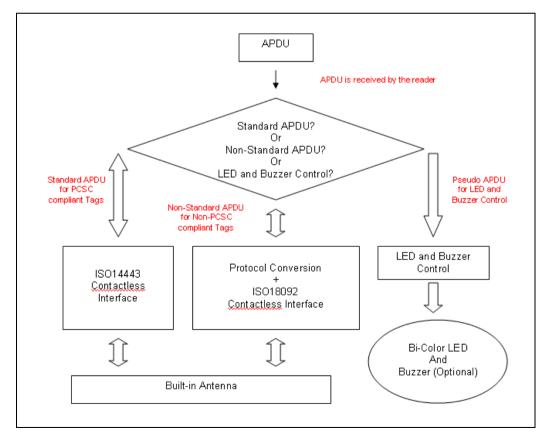

Figure 3: Basic Program Flow for Contactless Applications

- 1. For the ACR122U PICC Interface, ISO 7816 T=1 protocol is used.
  - PC → Reader: Issue an APDU to the reader.
  - Reader → PC: The response data is returned.

## 7.1. How to Access PC/SC-compliant Tags (ISO 14443-4)?

Basically, all ISO 14443-4 compliant cards (PICCs) would understand the ISO 7816-4 APDUs. The ACR122U Reader just has to communicate with the ISO 14443-4 compliant cards through exchanging ISO 7816-4 APDUs and Responses. ACR122U will handle the ISO 14443 Parts 1-4 Protocols internally.

Mifare 1K, 4K, MINI and Ultralight tags are supported through the T=CL emulation. Just simply treat the Mifare tags as standard ISO 14443-4 tags. For more information, please refer to topic "PICC Commands for Mifare Classic Memory Tags".

#### ISO 7816-4 APDU Format

| Command                    | Class | INS | P1 | P2 | Lc                          | Data In | Le  |
|----------------------------|-------|-----|----|----|-----------------------------|---------|---|
| ISO 7816 Part<br>4 Command | -     | -   | -  | -  | Length<br>of the<br>Data In | -       | Expected<br>length of the<br>Response<br>Data |

#### ISO 7816-4 Response Format (Data + 2 Bytes)

| Response | Data          | Out |     |
|----------|---------------|-----|-----|
| Result   | Response Data | SW1 | SW2 |

#### Response Codes

| Results | SW1 SW2 | Meaning                               |
|---------|---------|---------------------------------------|
| Success | 90 00h  | The operation completed successfully. |
| Error   | 63 00h  | The operation failed.                 |

#### Typical sequence may be:

- Present the Tag and Connect the PICC Interface
- Read/Update the memory of the tag

#### Step 1) Connect the Tag

Step 2) Send an APDU, Get Challenge.

<< 00 84 00 00 08h

>> 1A F7 F3 1B CD 2B A9 58h [90 00h]

Note: For ISO14443-4 Type A tags, the ATS can be obtained by using the APDU "FF CA 00 00 01h"

## 7.2. How to Access DESFire Tags (ISO 14443-4)?

DESFire supports ISO 7816-4 APDU Wrapping and Native modes. Once the DESFire Tag is activated, the first APDU sent to the DESFire Tag will determine the "Command Mode". If the first APDU is "Native Mode", the rest of the APDUs must be in "Native Mode" format. Similarly, if the first APDU is "ISO 7816-4 APDU Wrapping Mode", the rest of the APDUs must be in "ISO 7816-4 APDU Wrapping Mode" format.

#### **Example 1: DESFire ISO 7816-4 APDU Wrapping**

To read 8 bytes random number from an ISO 14443-4 Type A PICC (DESFire)

APDU = {90 0A 00 00 01 00 00h}

Class = 0x90; INS = 0x0A (DESFire Instruction); P1 = 0x00h; P2 = 0x00h

Lc = 0x01h; Data In = 0x00h; Le = 0x00h (Le = 0x00h for maximum length)

Answer: 7B 18 92 9D 9A 25 05 21h [\$91AFh]

The Status Code [91 AFh] is defined in DESFire specification. Please refer to the DESFire specification for more details.

#### **Example 2: DESFire Frame Level Chaining (ISO 7816 wrapping mode)**

In this example, the application has to do the "Frame Level Chaining". To get the version of the DESFire card.

Step 1: Send an APDU {90 60 00 00 00h} to get the first frame. INS=0x60

Answer: 04 01 01 00 02 18 05 91 AFh [\$91AFh]

Step 2: Send an APDU {90 AF 00 00 00h} to get the second frame. INS=0xAF

Answer: 04 01 01 00 06 18 05 91 AFh [\$91AFh]

Step 3: Send an APDU {90 AF 00 00 00h} to get the last frame. INS=0xAFh

Answer: 04 52 5A 19 B2 1B 80 8E 36 54 4D 40 26 04 91 00h [\$9100h]

#### **Example 3: DESFire Native Command**

We can send Native DESFire Commands to the reader without ISO 7816 wrapping if we find that the Native DESFire Commands are easier to handle.

To read 8 bytes random number from an ISO 14443-4 Type A PICC (DESFire)

 $APDU = \{0A\ 00h\}$ 

Answer: AF 25 9C 65 0C 87 65 1D D7h [\$1DD7h]

In which, the first byte "AF" is the status code returned by the DESFire Card.

The Data inside the blanket [\$1DD7] can simply be ignored by the application.

#### **Example 4: DESFire Frame Level Chaining (Native Mode)**

In this example, the application has to do the "Frame Level Chaining".

To get the version of the DESFire card.

Step 1: Send an APDU {60h} to get the first frame. INS=0x60h

Answer: AF 04 01 01 00 02 18 05h[\$1805h]

Step 2: Send an APDU {AFh} to get the second frame. INS=0xAFh

Answer: AF 04 01 01 00 06 18 05h[\$1805h]

Step 3: Send an APDU {AFh} to get the last frame. INS=0xAFh Answer: 00 04 52 5A 19 B2 1B 80 8E 36 54 4D 40 26 04h[\$2604h]

**Note**: In DESFire Native Mode, the status code [90 00h] will not be added to the response if the response length is greater than 1. If the response length is less than 2, the status code [90 00h] will be added in order to meet the requirement of PC/SC. The minimum response length is 2.

## 7.3. How to Access FeliCa Tags (ISO 18092)?

Typical sequence may be:

- 1. Present the FeliCa Tag and Connect the PICC Interface.
- 2. Read/Update the memory of the tag.

#### Step 1) Connect the tag.

The ATR = 3B 8F 80 01 80 4F 0C A0 00 00 03 06 03 F0 11 00 00 00 00 8Ah In which.

F0 11 = FeliCa 212K

Step 2) Read the memory block without using Pseudo APDU.

<< 10 06h [8-byte NFC ID] 01 09 01 01 80 00h

>> 1D 07h [8-byte NFC ID] 00 00 01 00 AA 55 AA [90 00h]

or

Step 2) Read the memory block using Pseudo APDU.

<< FF 00 00 00 [13] D4 40 01 10 06 [8-byte NFC ID] 01 09 01 01 80 00h

In which,

[13] is the length of the Pseudo Data "D4 40 01.. 80 00h"

D4 40 01h is the Data Exchange Command

>> D5 41 00 1D 07h [8-byte NFC ID] 00 00 01 00 AA 55 AA 65 A

In which, D5 41 00h is the Data Exchange Response

Note: The NFC ID can be obtained by using the APDU "FF CA 00 00 00h"

Please refer to the FeliCa specification for more detailed information.

# 7.4. How to Access NFC Forum Type 1 Tags (ISO 18092), e.g. Jewel and Topaz Tags?

Typical sequence may be:

- 1. Present the Topaz Tag and Connect the PICC Interface.
- 2. Read/Update the memory of the tag.

```
Step 1) Connect the tag.
```

The ATR = 3B 8F 80 01 80 4F 0C A0 00 00 03 06 03 F0 04 00 00 00 00 9Fh In which, F0 04 = Topaz

Step 2) Read the memory address 08h (Block 1: Byte-0) without using Pseudo APDU

<< 01 08h

>> 18h [90 00h]

In which, Response Data = 18h

or

Step 2) Read the memory address 08h (Block 1: Byte-0) using Pseudo APDU

<< FF 00 00 00 [05] D4 40 01 01 08h

In which,

[05h] is the length of the Pseudo APDU Data "D4 40 01 01 08h"

D4 40 01h is the DataExchange Command.

01 08h is the data to be sent to the tag.

>> **D5 41 00 18h** [90 00h]

In which, Response Data = 18h

Tip: To read all the memory content of the tag

<< 00h

>> 11 48 18 26 .. 00h [90 00h]

Step 3) Update the memory address 08h (Block 1: Byte-0)with the data FFh

<< 53 08 FFh

>> FFh [90 00h]

In which, Response Data = FFh

Memory Address = Block No \* 8 + Byte No

E.g. Memory Address 08h (hex) =  $1 \times 8 + 0 = Block 1$ : Byte-0 = Data0

E.g. Memory Address 10h (hex) =  $2 \times 8 + 0 = Block 2$ : Byte-0 = Data8

| HR0             | HR1  |
|-----------------|------|
| 11 <sub>h</sub> | XX h |

|               |              |                 |        | EEPRO  | M Memory | Мар    |        |        |                 |          |
|---------------|--------------|-----------------|--------|--------|----------|--------|--------|--------|-----------------|----------|
| Туре          | Block<br>No. | Byte-0<br>(LSB) | Byte-1 | Byte-2 | Byte-3   | Byte-4 | Byte-5 | Byte-6 | Byte-7<br>(MSB) | Lockable |
| UID           | 0            | UID-0           | UID-1  | UID-2  | UID-3    | UID-4  | UID-5  | UID-6  |                 | Locked   |
| Data          | 1            | Data0           | Data1  | Data2  | Data3    | Data4  | Data5  | Data6  | Data7           | Yes      |
| Data          | 2            | Data8           | Data9  | Data10 | Data11   | Data12 | Data13 | Data14 | Data15          | Yes      |
| Data          | 3            | Data16          | Data17 | Data18 | Data19   | Data20 | Data21 | Data22 | Data23          | Yes      |
| Data          | 4            | Data24          | Data25 | Data26 | Data27   | Data28 | Data29 | Data30 | Data31          | Yes      |
| Data          | 5            | Data32          | Data33 | Data34 | Data35   | Data36 | Data37 | Data38 | Data39          | Yes      |
| Data          | 6            | Data40          | Data41 | Data42 | Data43   | Data44 | Data45 | Data46 | Data47          | Yes      |

| User Block Lock & Status  |
| OTP bits                  |

Figure 4: Topaz Memory Map

Please refer to the Jewel and Topaz specification for more detailed information.

## 7.5. Getting the Current Setting of the Contactless Interface

Step 1) Get Status Command.

<< FF 00 00 00 02 D4 04h

>> D5 05h [Err] [Field] [NbTg] [Tg] [BrRx] [BrTx] [Type] 80 90 00h

Or if no tag is in the field

>> D5 05 00 00 00 80 90 00h

[Err] is an error code corresponding to the latest error detected.

Field indicates if an external RF field is present and detected (Field = 0x01h) or not (Field = 0x00h).

[NbTg] is the number of targets. The default value is 1.

[Tg]: logical number

[BrRx]: bit rate in reception

0x00h : 106 kbps 0x01h : 212 kbps 0x02h : 424 kbps

[BrTx]: bit rate in transmission

0x00h : 106 kbps 0x01h : 212 kbps 0x02h : 424 kbps

[Type ]: modulation type

0x00h : ISO 14443 or Mifare

0x10h : FeliCa™

0x01h: Active mode

0x02h: Innovision Jewel tag

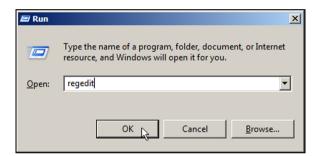

## Appendix A. ACR122U PC/SC Escape Command

- 1. Select the "ACS ACR122U PICC Interface 0"
- 2. Select the "Shared Mode" if the "ACR122U PICC Interface" is already connected, or "Direct Mode" if the "ACR122U PICC Interface" is not connected.
- 3. Press the **Connect** button to establish a connection between the PC and the ACR122U reader.
- 4. Enter "3500" in the Command Text Box
- 5. Enter the PC/SC Escape Command, e.g. "FF 00 48 00 00h" and press the button "Send" to send the command to the reader. #Get the firmware version
- 6. Press the **Disconnect** button to break the connection.
- 7. In order to send or receive Escape commands to a reader, follow the instructions below
- 8. The vendor IOCTL for the **Escape** command is defined as follows:

```
#define IOCTL CCID ESCAPE SCARD CTL CODE(3500)
```

The following instructions enumerate the steps to enable the PC/SC Escape command:

1. Execute the "regedit" in the "Run Command Menu" of Windows.

 Add a DWORD "EscapeCommandEnable" under HKLM\SYSTEM\CCS\Enum\USB\Vid\_072 F&Pid\_90CC\Device Parameters

For Vista, the path is:

Computer\HKEY\_LOCAL\_MACHINE\SYS TEMS\CurrentControlSet\Enum\USB

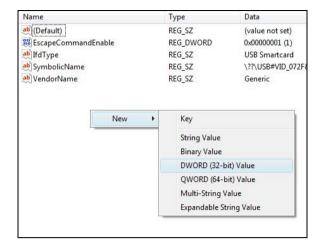

Look for: VID\_072F&PID\_2200
 Then expand the node. Look under Device parameters

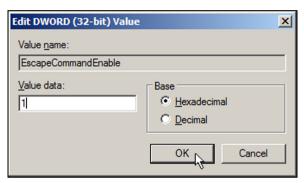

4. Create a DWORD entry (32-bit) with the name: EscapeCommandEnable

5. To Modify the value of the EscapeCommandEnable double click on the entry and input 1 in the Value data with the base set in Hexadecimal.

# Appendix B. APDU Command and Response Flow for ISO 14443-Compliant Tags

Assume an ISO 14443-4 Type B tag is used.

<< Typical APDU Command and Response Flow >>

| PC                           | Reader   | Tag  |
|------------------------------|--|--|
| Sequences                    | USB Interface  | RF Interface                                     |
|                              | (12 Mbps)  | (13.56 MHz)                                      |
| 1. The command is sent.      | Contactless Related Command                          | Tag-specific<br>Command Frame<br>——▶             |
|                              | [APDU Command] e.g. [00 84 00 00 08] (Get Challenge) | [APDU Command]<br>embedded in<br>ISO14443 Frame  |
| 2. The response is received. | Contactless Related Response                         | Tag-specific<br>Response Frame                   |
|                              | ←  | ←  |
|                              | [APDU Response]                                      |  |
|                              | <b>e.g.</b> [11 22 33 44 55 66 77 88] (90 00)        | [APDU Response]<br>embedded in<br>ISO14443 Frame |

# Appendix C. APDU Command and Response Flow for ISO 18092-Compliant Tags

Assume a TOPAZ tag is used.

<< Typical APDU Command and Response Flow >>

PC Reader Tag Sequences **USB** Interface RF Interface (12Mbps) (13.56MHz) 1. The command Contactless Related Command Tag-specific is sent **Command Frame** [Native Command] e.g. [01 08] (read memory address [Native Command] embedded in ISO18092 Frame or Pseudo APDU Command + [Native Command] e.g. FF 00 00 00 05 D4 40 01 [01 08] 2. The response Contactless Related Response Tag-specific is received Response Frame [Native Response] e.g. [Native e.g. 00 (90 00) Responsel embedded in ISO18092 Frame or Pseudo APDU Response + [Native Response] e.g. D5 41 00 [00] (90 00)

# Appendix D. Error Codes

| Error Code | Error   |
|------------|---|
| 0x00h      | No Error  |
| 0x01h      | Time Out, the target has not answered   |
| 0x02h      | A CRC error has been detected by the contactless UART   |
| 0x03h      | A Parity error has been detected by the contactless UART  |
| 0x04h      | During a Mifare anti-collision/select operation, an erroneous Bit Count has been detected   |
| 0x05h      | Framing error during Mifare operation   |
| 0x06h      | An abnormal bit-collision has been detected during bit wise anti-collision at 106 kbps  |
| 0x07h      | Communication buffer size insufficient  |
| 0x08h      | RF Buffer overflow has been detected by the contactless UART (bit BufferOvfl of the register ${\tt CL\_ERROR}$ )  |
| 0x0Ah      | In active communication mode, the RF field has not been switched on in time by the counterpart (as defined in NFCIP-1 standard)   |
| 0x0Bh      | RF Protocol error (cf. reference [4], description of the CL_ERROR register)   |
| 0x0Dh      | Temperature error: the internal temperature sensor has detected overheating, and therefore has automatically switched off the antenna drivers   |
| 0x0Eh      | Internal buffer overflow  |
| 0x10h      | Invalid parameter (range, format,)  |
| 0x12h      | DEP Protocol: The chip configured in target mode does not support the command received from the initiator (the command received is not one of the following: ATR_REQ, WUP_REQ, PSL_REQ, DEP_REQ, DSL_REQ, RLS_REQ, ref. [1]). |
|            | DEP Protocol / Mifare / ISO/IEC 14443-4: The data format does not match to the specification. Depending on the RF protocol used, it can be:   |
|            | <ul> <li>Bad length of RF received frame,</li> </ul>  |
| 0x13h      | <ul> <li>Incorrect value of PCB or PFB,</li> </ul>  |
|            | <ul> <li>Invalid or unexpected RF received frame,</li> </ul>  |
|            | NAD or DID incoherence.   |
| 0x14h      | Mifare: Authentication error  |
| 0x23h      | ISO/IEC 14443-3: UID Check byte is wrong  |
| 0x25h      | DEP Protocol: Invalid device state, the system is in a state which does not allow the operation   |
| 0x26h      | Operation not allowed in this configuration (host controller interface)   |
| 0x27h      | This command is not acceptable due to the current context of the chip (Initiator vs. Target, unknown target number, Target not in the good state,)  |
| 0x29h      | The chip configured as target has been released by its initiator  |
| 0x2Ah      | ISO/IEC 14443-3B only: the ID of the card does not match, meaning that the expected card has been exchanged with another one.   |

| Error Code | Error  |
|------------|--|
| 0x2Bh      | ISO/IEC 14443-3B only: the card previously activated has disappeared.                    |
| 0x2Ch      | Mismatch between the NFCID3 initiator and the NFCID3 target in DEP 212/424 kbps passive. |
| 0x2Dh      | An over-current event has been detected  |
| 0x2Eh      | NAD missing in DEP frame   |

# Appendix E. Sample Codes for Setting the LED

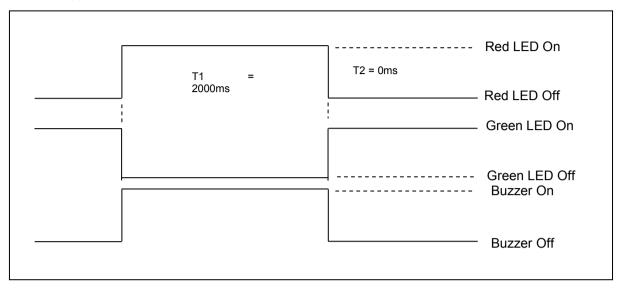

| Example 1: To read the existing LED State.  |                                |
|---|--------------------------------|
| // Assume both Red and Green LEDs are OFF initially //  |                                |
| // Not link to the buzzer //  |                                |
| APDU = "FF 00 40 00 04 00 00 00 00h"  |                                |
| Response = "90 00h". RED and Green LEDs are OFF.  |                                |
| Example 2: To turn on RED and Green Color LEDs.   |                                |
| // Assume both Red and Green LEDs are OFF initially //  |                                |
| // Not link to the buzzer //  |                                |
| APDU = "FF 00 40 0F 04 00 00 00 00h"  |                                |
| Response = "90 03h". RED and Green LEDs are ON,   |                                |
| To turn off both RED and Green LEDs, APDU = "FF 00 40 0C 04 00 00 00 00h"   |                                |
|   |                                |
| Example 3: To turn off the RED Color LED only, and leave the Green Color LE   | D unchanged.                   |
| Example 3: To turn off the RED Color LED only, and leave the Green Color LE // Assume both Red and Green LEDs are ON initially // | D unchanged.                   |
|   | D unchanged.                   |
| // Assume both Red and Green LEDs are ON initially //   | D unchanged.                   |
| // Assume both Red and Green LEDs are ON initially // // Not link to the buzzer //  | D unchanged.                   |
| // Assume both Red and Green LEDs are ON initially // // Not link to the buzzer // APDU = "FF 00 40 04 04 00 00 00 00h"           | D unchanged.                   |
| // Assume both Red and Green LEDs are ON initially // // Not link to the buzzer // APDU = "FF 00 40 04 04 00 00 00 00h"           | <b>D unchanged.</b> Red LED On |
| // Assume both Red and Green LEDs are ON initially // // Not link to the buzzer // APDU = "FF 00 40 04 04 00 00 00 00h"           |                                |
| // Assume both Red and Green LEDs are ON initially // // Not link to the buzzer // APDU = "FF 00 40 04 04 00 00 00 00h"           | Red LED On                     |
| // Assume both Red and Green LEDs are ON initially // // Not link to the buzzer // APDU = "FF 00 40 04 04 00 00 00 00h"           | Red LED On<br>Red LED Off      |

#### Example 4: To turn on the Red LED for 2 seconds. After that, resume to the initial state.

// Assume the Red LED is initially OFF, while the Green LED is initially ON. //

// The Red LED and buzzer will turn on during the T1 duration, while the Green LED will turn off during the T1 duration. //

1Hz = 1000ms Time Interval = 500ms ON + 500 ms OFF

T1 Duration = 2000ms = 0x14h

T2 Duration = 0ms = 0x00h

Number of repetition = 0x01h

Link to Buzzer = 0x01h

APDU = "FF 00 40 50 04 14 00 01 01h"

Response = "90 02h"

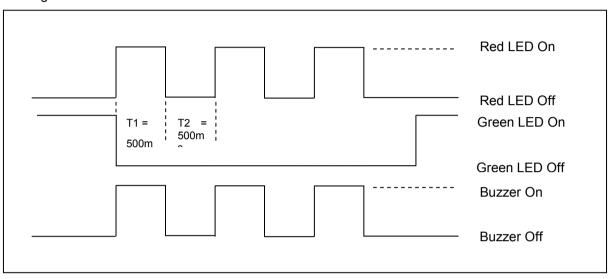

## Example 5: To make the Red LED blink at 1 Hz, three times. After which, it resumes to initial state.

// Assume the Red LED is initially OFF, while the Green LED is initially ON. //

// The Initial Red LED Blinking State is ON. Only the Red LED will be blinking.

// The buzzer will turn on during the T1 duration, while the Green LED will turn off during both the T1 and T2 duration.

// After the blinking, the Green LED will turn ON. The Red LED will resume to the initial state after the blinking //

1Hz = 1000ms Time Interval = 500ms ON + 500 ms OFF

T1 Duration = 500ms = 0x05h

T2 Duration = 500ms = 0x05h

Number of repetition = 0x03h

Link to Buzzer = 0x01h

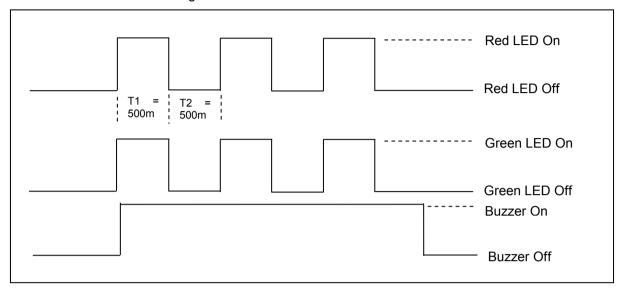

APDU = "FF 00 40 50 04 05 05 03 01h"

Response = "90 02h"

#### Example 6: To make the Red and Green LEDs blink at 1 Hz three times.

- // Assume both the Red and Green LEDs are initially OFF. //
- // Both Initial Red and Green Blinking States are ON //
- // The buzzer will turn on during both the T1 and T2 duration//

1Hz = 1000ms Time Interval = 500ms ON + 500 ms OFF

T1 Duration = 500ms = 0x05h

T2 Duration = 500ms = 0x05h

Number of repetition = 0x03h

Link to Buzzer = 0x03h

APDU = "FF 00 40 F0 04 05 05 03 03h"

Response = "90 00h"

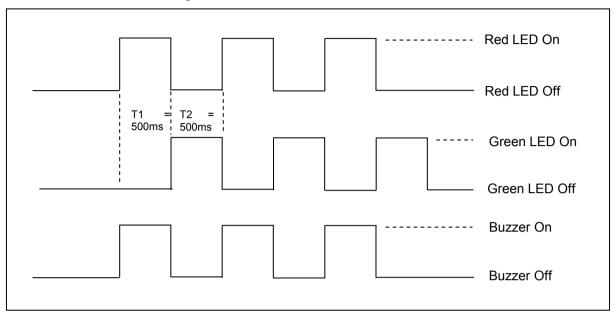

#### Example 7: To make Red and Green LED blink in turns at 1Hz three times.

// Assume both Red and Green LEDs are initially OFF. //

// The Initial Red Blinking State is ON; The Initial Green Blinking States is OFF //

// The buzzer will turn on during the T1 duration//

1Hz = 1000ms Time Interval = 500ms ON + 500 ms OFF

T1 Duration = 500ms = 0x05h

T2 Duration = 500ms = 0x05h

Number of repetition = 0x03h

Link to Buzzer = 0x01h

APDU = "FF 00 40 D0 04 05 05 03 01h"; Response = "90 00h"
